PROACTIVE HEALTH CARE, TODAY

CO3 Corp creates advanced technology driven solutions in pursuit of a revolutionary proactive health care model. Reactive systems are costly and less efficient during periods of critical outbreaks, during the introduction of new therapies and in managing exponential growth in demand for services.

Proactive and predictive models can be achieved today with CareCentral, a new and radical information management and collaboration platform from CO3 Corp.

A revolution is taking place in health care, outside of the reach of regulators. Unwillingness to wait on governments and other care providers to deal with chronic service shortcomings, patients worldwide have taken matters in their own hands. They seek alternative answers on the Internet. This dangerous trend is growing rapidly as are the inherent risks to patients. Health care managers however, must refrain from foot dragging and begin to compete for mind share with compelling modernized service models.

CareCentral embodies a bold new philosophy that places the legacy health provider back at the forefront.

The best technology solutions are not the most complex or costly. In fact, a quick review of the most successful and revolutionary hi tech applications introduced in the past ten years reveals an opposite trend. Web browsers, file-sharing applications, software media players and instant messaging tools have revolutionized our modern culture, to a far greater extent than many more complex and expensive products. These breakthrough innovations share in common a high degree of automation, user friendliness and manageability that has turned previously difficult tasks into simple, almost background activities.

At CO3 Corp we have espoused the view that the best technologies are the most affordable, most usable and most manageable. In a nutshell the most value for cost.

Today, while using CO3 Corp's next generation collaboration and connectivity tools, health care managers can quickly and easily link service providers to their information resources and to each other. Our solutions deploy in a fraction of the time and cost to implement inferior and more complex technologies. Smart easy to use connectivity, research and collaboration tools make proactive medicine possible.

CareCentral is the next wave in health care, today.

In the future, CareCentral networks will interconnect with each other around the world providing the ultimate integrated and proactive delivery system conceivable. CO3 Corp invites all who desire and pursue a new and better course than is offered by our struggling grid locked system to join in this bold new vision, today.

2 - Trusted Connectivity

CO3 CONNECT

CO3 Connect is the technology layer that sits underneath CareCentral and provides secure connectivity to information resources over the Internet. CO3 Connect can be deployed on a standalone basis or together with CareCentral.

There are endless types of clinical electronic information resources that never have and will never be interoperable. Electronic Health Records, lab results, clinical software applications, and databases are often only available to practitioners onsite or remotely on a limited basis. Today however, it is possible to access and use these resources through a new and powerful Trusted Connectivity platform called CO3 Connect. CO3 Connect is an advanced solution that makes it easy and safe to access multiple resources concurrently, no matter where they are located or where the user is.

CO3 Connect Gateway Servers are deployed at central locations where the critical information resources are located, for example at hospitals, clinics and data centers. CO3 Connect is very easy to deploy at both the institution and user levels and is unrivaled in its simplicity and robustness. Best of all, CO3 Connect works with existing IT and information architectures and does not require any overhaul of legacy systems.

Several critical drivers combine to fuel demand for remote access in the hospital sector including the need to securely access patient records and test results, for transcribers to remotely access physician notes, for technical staff to remotely access IT systems, for business continuity systems.

Factors creating barriers to remote access deployment include: privacy considerations, the lack of in house expertise, cost, increase in helpdesk load, lack of scalability, managing physician owned computing devices.

Today, physicians access clinical browsers at hospitals without having to leave their clinics or homes for that matter. CO3 Connect was instrumental in allowing practitioners and non-medical staff to access critical resources during the recent outbreaks at which time physical access to hospitals was greatly restricted and even dangerous.

Physicians from a wide range of disciplines were able to access hospital resources over three thousand times in the first three months of this year. As a result, more patients were served, fewer errors made, releases and transfers happened faster and costs were lowered.

CO3 Connect is the first Trusted Connectivity platform that enables organizations to rapidly deploy dynamic Secure Collaborative Networks. CO3 Connect is a turnkey, owner-managed application platform that deploys in a fraction of the time required to roll out conventional remote access solutions and scales to the needs of the largest distributed enterprise. CO3 Connect delivers significant advantages over traditional bolt-on architectures and is based on principals of extreme process automation and aggressive IT asset leveraging.

A CLINICAL RESOURCE BROWSER

CareCentral is a highly customizable web based environment that leverages the powerful security and connectivity features in CO3 Connect. CareCentral is an overlay that allows clinical information resources and applications scattered over any number of locations to be access and viewed through a simple elegant interface.

CO3 Connect's unique ability to enable multiple concurrent connections to any number of remote gateway servers provides the underlying secure network for the CareCentral browser interface. Built-in security features insure that only authorized users are able to access sensitive resources. Whether analyzing lab results located in one city, or patient records in another, the practitioner is only required to know how to use a common web browser such as Internet Explorer to access clinical resources.

Each implementation of CareCentral is carefully customized by CO3 Corp's Professional Services, in consultation with the full spectrum of providers and institutions.

SECURE COLLABORATIVE NETWORKS

CareCentral includes a dynamic web platform which allows an individual or community of users to publish, manage and organize a variety of content. CareCentral integrates many popular features of content management systems, weblogs (blogs), automated advanced publishing tools and discussion-based community functions into one easy-to-use interface.

CO3 Corp designs customized secure collaborative networks to be used for a combination of knowledge management, web publishing and private community interaction purposes:

- **Content Management.** Using a simple, browser-based interface, members can publish to a number of available content modules: collaborative books, articles, blogs, polls, images, forums, downloads, etc. A powerful and flexible classification system allows hierarchical classifications, cross-indexing of publishing nodes and multiple category sets for various content types.
- **Weblog.** Also called blogs, weblogs are popular venues for individual or group publishing. CareCentral supports RSS syndication for each individual blog and can be set to notify other users when new content is posted on a specific node.
- **Discussion-based community.** As well as topic oriented threaded discussion boards, comment boards attached to most content types, make it simple for members to discuss new posts.

A NEXT GENERATION RESEARCH PLATFORM

CO3 Professional Services will further customized CareCentral to function as a very powerful Clinical Research Platform. Again, by leveraging CO3 Connect's underlying connectivity and

security capabilities, CareCentral can concurrently connect to and query multiple databases regardless of where they are located. Each database interface is abstracted to enable unified queries from a single web based interface. Query results are transformed on the fly providing researchers with a harmonized view of their structured clinical data. Research can be undertaken on live bases or by using CareCentral Unified Query function to first populate a dedicated research database.

CareCentral is also capable of exploiting session Meta Data generated by CO3 Connect. CO3 Connect is the only connectivity solution that generates a granular audit trail of network and resource usage. Session Meta Data provides valuable system usage information for decision support and efficiency analyses.

CareCentral further provides researchers with another unique and novel source of research material - data generated in the various publishing and collaboration tools discussed in the section above. When extended out to the patient community, large amounts of searchable community and Med generated content make CareCentral the most advanced research platform available today.

ABOUT CO3 CORP

CO3 Corp solutions make it easy and safe for organizations, their customers and employees to "Connect, Communicate and Collaborate™".

CO3 Corp was born to create and leverage revolutionary new technologies that transform the current grid locked system from a high overhead, segmented and disconnected structure to an integrated patient centric model.

CO3 Corp has acquired exclusive manufacturing and distribution rights to Yo Inc's highly acclaimed Trusted Connectivity application platform - CO3 Connect™, as well as specific health care sector customers. CO3 Connect is a unique Trusted Connectivity enterprise strength server that enables organizations to rapidly deploy Secure Collaborative Networks. Using CO3 Connect hospitals and other health care providers allow physicians to securely access electronic patient records and other highly sensitive information.
